

RWE relevance audit

September 8, 2026 | Core catalogue, discovery archive and borderline review

The 6,227 previously active cards have been reviewed: **4,218 Core**, **2,008 Archive**, and **1 Borderline**. One earlier historical hold (RWE-0115) remains separate. All 6,228 IDs are preserved in the workbook.

Scope and evidence

Individual relevance review of recorded capabilities and limitations, with explicitly identified source follow-ups. No new discovery stopping-rule claim and no runtime testing.

Core requires an explicit RWE, HEOR, epidemiology, public-health, clinical-data, evidence-synthesis or specific statistical-method function. Generic scholarly retrieval can qualify as an evidence method. Merely mentioning health, disease or possible downstream use is insufficient. Mixed projects qualify only for the function named in their rationale.

Archive preserves adjacent discoveries, including general climate/disaster feeds, molecular-only tools, generic AI benchmarks and productivity workflows. Archive is a scope decision, not a finding that the project is defective.

The core is a catalogue of capability records, not a count of unique MCP servers. It includes skills, components, libraries and agent workflows, including related implementations. Relevance review does not establish runtime, methodological, clinical, security or privacy validation.

The earlier search report remains a historical account of the broader discovery campaign. Its two successive zero-new rounds do not establish search saturation under this narrower relevance boundary.

Borderline questions

- **RWE-2879 - data-designer/raghealth**: RAGHealth predicts patient outcomes using MIMIC/eICU data. The reviewed documentation does not establish a separate cohort-preparation or feature-extraction method beyond model training and inference. Keep outside Core until that research-data function is documented. [Source](#).

Corrected historical descriptions

Five historical cards received scoped descriptions or tool lists: RWE-0843 (the Public Health component rather than its parent cybersecurity README), RWE-0845 (Academic Research component), RWE-0851 (ToolUniverse literature scope), RWE-0202 (named clinical measurement instruments), and RWE-0240 (the mcp-epic FHIR retrieval component). Their earlier source-check dates remain historical; this relevance audit has its own date.

The JSON audit contains every decision, reason, evidence level and source reference. The workbook places Core, Archive, Borderline and the historical hold on separate sheets.
